EDUCATION

China Agricultural University

Expected Jul 2027

B.Eng. in Computer Science and Technology | Beijing, China

GPA: 3.73/4.00

Selected Coursework: Machine Learning (A), Operating Systems (A), Computer Architecture (A), Compiler Principles (A), Data Structures (A), Artificial Intelligence (A)

RESEARCH INTERESTS

AI Systems · Efficient AI · Edge AI & AIoT

RESEARCH EXPERIENCE

Task Information and Label Order in Zero-Shot LLM Classification

May 2026 - Aug 2026

Independent Research | Zero-Shot LLM Evaluation

- Conducted controlled zero-shot LLM evaluations to study how added task information interacts with label order across multiple models and tasks, using a disjoint confirmation set and a frozen paired analysis.
- Extended the study with robustness checks, alternative scoring rules, semantic controls, and comprehensive label-order evaluations; completed and submitted a manuscript based on this work.

Continuous-Action MAPPO with Communication-Free Local MPC

Aug 2026

Individual Summer Research Project, Zhejiang University | Supervisor: Prof. Fei Miao

- Implemented a continuous-action MAPPO variant with training-time assignment guidance under centralized training and decentralized execution. A 2×2 controlled ablation across four configurations and five training seeds (500 evaluation episodes per configuration) showed that the continuous-action, assignment-guided configuration achieved 41.2% terminal success, 23.6 percentage points above its discrete-action counterpart.
- Developed a communication-free local MPC controller with planning horizon $H=5$, using only each agent's current and previous local observations at execution. Relative to a local-MPC baseline that used the raw policy action as an executable candidate, it reduced controller intervention and saturated-action rates by 9.2 and 14.0 percentage points, while terminal success changed from 62.4% to 61.6% (-0.8 percentage points).
- Selected controller variants only on disjoint development seeds, then froze code, policy checkpoints, controller settings, confirmation seeds, and 19 prespecified acceptance criteria before a locked 1,500-episode evaluation across five independently trained policies using matched environment seeds; the final controller passed all 19 criteria.

MaizeGuard: Multi-Ear Abnormal-Region Analysis and Local Deployment [\[GitHub\]](#) **Jul 2025 - Jun 2026**
Undergraduate Innovation Project, China Agricultural University | Supervisor: Assoc. Prof. Qin Ma

- Led a five-member undergraduate innovation project and continued the system reconstruction as an individual project, transforming its superpixel-based prototype into a locally deployable dual-ONNX pipeline for multi-ear localization, instance splitting, abnormal-region segmentation, and area-ratio reporting.
- Designed and completed five rounds of AI-generated candidate proposals followed by human adjudication, covering 180 images and 402 ears and yielding 285 trainable pseudo-labels with explicit relabel, skip, and quarantine states.
- Benchmarked the dual-ONNX pipeline on an AMD Ryzen 9 7945HX: for six 384×384 ear crops, dynamic batching increased CPU segmenter throughput by 28.2% (83.5→107.0 ears/s) over 100 timed runs while preserving the same final mask on the benchmark input; the complete in-memory pipeline averaged 234.5 ms end to end (P95 289.1 ms), with CUDA execution validated on an RTX 4060 Laptop GPU.

WORK EXPERIENCE

360 Digital Security Group

AI Application Development Intern

Jul 2026 - Aug 2026

Qwen-VL-Based Visual Data Pre-Annotation Pipeline

- Built a Qwen-VL-based object-detection pre-annotation pipeline with API integration, prompt and structured-output design, coordinate conversion, result parsing, visual verification, and COCO-format annotation generation.
- Expanded the annotation schema from 3 to 14 classes and established a human-in-the-loop workflow spanning model pre-annotation, programmatic validation, platform import, and manual review, supporting the delivery of approximately 10,000 images.

AI Engineering Intern (Computer Vision & Edge Deployment)

Jan 2026 - Mar 2026

Objects365-Based YOLOv8 Object Detection and NCNN Inference Pipeline

- For a 50-class object detection task, built an Objects365 v1 data-processing pipeline that screened and processed 460,000+ images, implementing 365-to-50 class mapping, anomalous-data filtering, COCO-to-YOLO annotation conversion, and visual verification.
- Participated in multi-GPU YOLOv8n training; converted the trained PyTorch model to NCNN and validated batch-1 inference at 640 × 640. The exported model was approximately 11.6 MB and achieved an observed latency of 58.4 ms in the recorded test environment.

SELECTED PROJECTS

AI-Assisted Learning System for Compiler Principles

Mar 2026 - Jun 2026

Individual Course Project

- Built reusable Python/PyQt6 modules for DFA-based lexical analysis, Chomsky grammar classification, FIRST/FOLLOW computation, LL(1) parsing tables, recursive-descent parsing, AST construction, and panic-mode error recovery.
- Designed a FEEDBACK domain-specific language and an LLM–parser diagnostic loop that validated generated feedback, returned structured errors for retry, and passed 26 offline acceptance checks.

HONORS AND AWARDS

Second-Class Academic Scholarship, China Agricultural University

2023 - 2024

TECHNICAL SKILLS

Programming Languages: Python, C/C++, SQL

ML & Research Tools: PyTorch, OpenCV, scikit-learn; Git, Linux/Bash, LaTeX
