EDUCATION

China Agricultural University

Expected Jun 2027

B.Eng. in Computer Science and Technology | Beijing, China

GPA: 3.72/4.00

Selected Coursework: Machine Learning (A), Operating Systems (A), Computer Architecture (A), Compiler Principles (A), Data Structures (A)

RESEARCH INTERESTS

Efficient AI & ML Systems · Edge/AIoT · Industrial AI

RESEARCH EXPERIENCE

Task Information and Label Order in Zero-Shot LLM Classification

Jun 2026 - Aug 2026

Independent Research | Zero-Shot LLM Evaluation

- Investigated whether adding class-definition text changes zero-shot classification accuracy differently across label orders, without training or fine-tuning the models; froze a per-example difference-in-differences contrast before evaluation on a disjoint 7,600-example confirmation set.
- Executed a 2-model $\times$ 3-controlled-paraphrase $\times$ 4-order $\times$ 4-level confirmation study; Phi-3-mini showed a +17.969-pp interaction (95% CI [16.811, 19.075]), while Qwen2.5-1.5B did not meet the predefined cross-paraphrase robustness criterion.
- Extended the evaluation to three model checkpoints, three tasks, alternative scoring rules, semantic-alignment and neutral-label controls, and all 24 AG News label permutations, yielding 840 valid experimental conditions and 4,001,040 per-example predictions.
- Completed and submitted the manuscript to *Information Processing & Management*.

Continuous-Action MAPPO with Communication-Free Local MPC

Aug 2026

Individual Summer Research Project, Zhejiang University | Supervisor: Prof. Fei Miao

- Implemented a continuous-action MAPPO variant with training-time assignment guidance under centralized training and decentralized execution. A 2 $\times$ 2 controlled ablation across four configurations and five training seeds (500 evaluation episodes per configuration) showed that the continuous-action, assignment-guided configuration achieved 41.2% terminal success, 23.6 percentage points above its discrete-action counterpart.
- Developed a communication-free local MPC controller with planning horizon $H=5$, using only each agent's current and previous local observations at execution. Relative to the actor-candidate local-MPC baseline that included the raw policy action, it reduced controller intervention and saturated-action rates by 9.2 and 14.0 percentage points, while terminal success changed from 62.4% to 61.6% (-0.8 percentage points).
- Selected controller variants only on disjoint development episode seeds, then froze source code, policy checkpoints, controller settings, confirmation seeds, and acceptance criteria. The locked evaluation compared three modes on the same 100 environment seeds for each of five independently trained frozen policies (1,500 episodes total); the final controller passed all 19 prespecified criteria.

MaizeGuard: Multi-Ear Abnormal-Region Analysis and Local Deployment [\[GitHub\]](#)

Jul 2025 - Jun 2026

Undergraduate Innovation Project, China Agricultural University | Supervisor: Assoc. Prof. Qin Ma

- Led a five-member undergraduate innovation project and continued the system reconstruction as an individual project, transforming its superpixel-based prototype into a locally deployable dual-ONNX pipeline for multi-ear localization, instance splitting, abnormal-region segmentation, and area-ratio reporting.
- Designed and completed five rounds of an AI-candidate-generation and human-adjudication workflow covering 180 images and 402 ears, yielding 285 trainable pseudo-labels with explicit relabel, skip, and quarantine states.
- Benchmarked the dual-ONNX pipeline with ONNX Runtime 1.20.2 on an AMD Ryzen 9 7945HX: for six 384 $\times$ 384 ear crops, dynamic batching increased CPU segmenter throughput by 28.2% (83.5 $\rightarrow$ 107.0 ears/s) over 100 timed runs while preserving the same final mask on the benchmark input; the complete in-memory pipeline averaged 234.5 ms end to end (P95 289.1 ms), with CUDA execution validated on an RTX 4060 Laptop GPU.

INDUSTRY EXPERIENCE

360 Digital Security Group | Web Backend Development Intern

Jan 2026 - Mar 2026

Objects365-Based YOLOv8 Object Detection and NCNN Inference Pipeline

- For a 50-class object detection task, built an Objects365 v1 data-processing pipeline that screened and processed 460,000+ images, implementing 365-to-50 class mapping, anomalous-data filtering, COCO-to-YOLO annotation conversion, and visual verification.
- Participated in multi-GPU YOLOv8n training; converted the trained PyTorch model to NCNN and validated batch-1 inference at 640×640 . The exported model was approximately 11.6 MB and achieved an observed latency of 58.4 ms in the recorded test environment.

SELECTED PROJECTS

AI-Assisted Learning System for Compiler Principles

Mar 2026 - Jun 2026

Individual Course Project

- Built reusable Python/PyQt6 modules for DFA-based lexical analysis, Chomsky grammar classification, FIRST/FOLLOW computation, LL(1) parsing tables, recursive-descent parsing, AST construction, and panic-mode error recovery.
- Designed a FEEDBACK domain-specific language and an LLM–parser diagnostic loop that validated generated feedback, returned structured errors for retry, and passed 26 offline acceptance checks.

CAU Campus Marketplace WeChat Mini Program

Mar 2026 - Jun 2026

Team Lead, 5-Person Software Engineering Project

- Led requirements and design iterations (SRS, SDD, and DDD), database-schema review, and front-end/back-end API alignment for a native WeChat Mini Program backed by ASP.NET Core/.NET 10, EF Core/MySQL, and SignalR.
- Implemented selected backend functionality, coordinated integration and defect resolution, and designed smoke and regression tests across authentication, listing, trading/rental, chat, request, and risk-control workflows.

HONORS AND AWARDS

Second-Class Academic Scholarship, China Agricultural University

2023 - 2024

TECHNICAL SKILLS

Programming Languages: Python, C/C++, SQL

ML & Research Tools: PyTorch, OpenCV, scikit-learn; Git, Linux/Bash, LaTeX
