## EDUCATION

---

**China Agricultural University**

**Expected Jul 2027**

*B.Eng. in Computer Science and Technology | Beijing, China*

**GPA:** 3.73/4.00

**Selected Coursework:** Machine Learning (A), Operating Systems (A), Computer Architecture (A), Compiler Principles (A), Data Structures (A), Artificial Intelligence (A)

## RESEARCH INTERESTS

---

Efficient AI Systems · Inference Systems · Heterogeneous Computing

## RESEARCH EXPERIENCE

---

**Prompt Evaluation Reliability in Zero-Shot Text Classification**

**May 2026 - Aug 2026**

*Independent Research | Zero-Shot LLM Evaluation*

- **Overview:** Investigated the reliability of prompt evaluation in zero-shot text classification by testing how class-description content and label ordering interact across pretrained models.
- **Contribution:** Designed disjoint development and confirmation sets, froze the confirmation protocol before evaluation, implemented and debugged the evaluation code, and conducted paired statistical analyses, result checks, and follow-up control experiments.
- **Results:** Completed a research manuscript and supporting evaluation code, with controlled confirmation experiments and robustness analyses across multiple models, tasks, scoring rules, and label orders.

**Decentralized Multi-Agent Coordination via Reinforcement Learning and Local Planning**

**Aug 2026**

*Individual Summer Research Project, Zhejiang University | Supervisor: Prof. Fei Miao*

- **Overview:** Combined MAPPO policy learning with local model predictive control in MPE2 to coordinate three communication-free agents covering three targets while reducing collisions, forming a decentralized-execution system in which learned cooperative actions are corrected through local planning.
- **Contribution:** Designed experiments and selected methods through a 2×2 ablation of discrete/continuous actions and assignment guidance, plus paired tests of arrival protection and temporal smoothing. Both studies used five training seeds and a total of 500 evaluation episodes per configuration, with 25 steps per episode.
- **Results:** Delivered training/evaluation code, models, and visual demonstrations. Continuous actions with assignment guidance achieved 41.2% terminal success, 23.6 percentage points above the guided discrete policy. In independent controller tests, arrival protection and temporal smoothing reduced intervention and action-saturation rates by 9.2 and 14.0 percentage points, while terminal success decreased from 62.4% to 61.6%.

**MaizeGuard: Lightweight Maize Ear Anomaly Segmentation System** [\[GitHub\]](#)**Jul 2025 - Jun 2026***Undergraduate Innovation Project, China Agricultural University | Supervisor: Assoc. Prof. Qin Ma*

- **Overview:** Developed a local system for automated detection and abnormality quantification in multi-ear maize images. A two-stage pipeline combines full-image foreground localization and instance splitting with batched segmentation of ear crops, producing per-ear abnormality masks and area ratios.
- **Contribution:** Designed a three-class annotation protocol and a workflow combining AI-generated candidates, human adjudication, and difficult-sample quarantine. Reviewed 402 ears from 180 images to produce 285 human-adjudicated training pseudo-labels, and led supervised/EMA model comparisons, error analysis, and deployment decisions.
- **Results:** Delivered a local Streamlit system using two FP32 ONNX models. For a six-ear input on a Ryzen 9 7945HX, CPU dynamic batching increased abnormal-region segmenter throughput from 83.5 to 107.0 ears/s (1.28×); the complete in-memory pipeline averaged 234.5 ms end to end.

**Software Copyright Registration:** The project software was registered in China (Reg. No. 2026SR0822662, 2026).

**WORK EXPERIENCE****360 Digital Security Group****AI Application Development Intern****Jul 2026 - Aug 2026***Qwen-VL-Based Visual Data Pre-Annotation Pipeline*

- Built a Qwen-VL-based object-detection pre-annotation pipeline, covering API integration, prompt and structured-output design, coordinate conversion, result parsing, visual verification, and COCO-format annotation generation.
- Expanded the annotation schema from 3 to 14 classes and established a workflow combining model pre-annotation, programmatic validation, platform import, and human review, supporting the delivery of approximately 10,000 images.

**AI Engineering Intern (Computer Vision & Edge Deployment)****Jan 2026 - Mar 2026***Objects365-Based YOLOv8 Object Detection and NCNN Inference Pipeline*

- For a 50-class object-detection task, built an Objects365 v1 data-processing pipeline, screening and processing 460,000+ images and completing class mapping, anomalous-data filtering, COCO-to-YOLO annotation conversion, and visual verification.
- Participated in multi-GPU YOLOv8n training, exported the trained model to FP32 NCNN format, and completed single-image object-detection validation at 640×640 input resolution.
